

# RETAINIFY — Employee Attrition Prediction System

---

Submitted by — Krithika M

---

## Project Statement

The objective of this project is to analyze IBM HR workforce data to uncover employee attrition patterns, retention risk factors, and organizational trends using machine learning and explainable AI techniques. The goal is to help HR teams and business leaders identify at-risk employees early, understand the key drivers behind turnover, and take data-driven retention action through an interactive enterprise web platform.

---

## Modules Implemented

1. Data Acquisition and Understanding
  2. Data Cleaning and Preprocessing
  3. Feature Engineering and Scaling
  4. Model Training and Hyperparameter Tuning
  5. Model Evaluation and Threshold Optimization
  6. Attrition Driver Analysis
  7. Employee Trends Visualization
  8. Backend API Development
  9. Frontend Dashboard
  10. Deployment and Documentation
- 

## 1. Data Acquisition and Understanding

The purpose of this module was to collect, load, and understand the raw dataset before analysis. This step ensured that the data was accurate, complete, and structured for efficient processing. By performing initial exploration and validation, the foundation was laid for preprocessing, feature engineering, and model training in later stages.

---

## Dataset Overview

**Dataset Name:** raw-data.csv **Shape:** 1,470 rows × 35 columns

The raw dataset contains records of employee profiles across an organization, including demographic information, job role details, compensation data, satisfaction scores, performance ratings, and attrition status. It serves as the foundation for analyzing workforce patterns, attrition risk, and retention drivers.

---

## Goals

- Build a clean and reliable data foundation for attrition prediction modeling.

- Define and extract key behavioral and organizational features to support machine learning.
  - Ensure data quality by identifying missing values, constant columns, and structural inconsistencies.
  - Store preprocessed data in a reusable format for faster downstream development.
- 

### Key Performance Indicators (KPIs)

| KPI                    | Description                                                 |
|------------------------|-------------------------------------------------------------|
| Attrition Rate         | Proportion of employees who left over total workforce       |
| Recall Score           | Percentage of actual at-risk employees correctly identified |
| Risk Score             | Predicted attrition probability scaled to 0–10              |
| Replacement Cost       | Estimated financial cost if high-risk employee departs      |
| Workforce Health Index | Overall organizational retention score out of 100           |

---

### Workflow

- Project scope established for attrition prediction and retention analysis.
  - KPIs identified to measure model effectiveness and business impact.
  - Workflow defined: Data ingestion → Preprocessing → Feature Engineering → Model Training → Evaluation → Deployment
- 

### Load CSV Using Pandas

Raw data was loaded from the IBM HR Analytics dataset using `pandas.read_csv()`.

The dataset contains:

- **1,470 rows**
  - **35 columns**
- 

### Exploring Schema, Types, Size, and Nulls

| Check             | Findings                                                                          |
|-------------------|-----------------------------------------------------------------------------------|
| Schema and Dtypes | Mix of int64 and object types; satisfaction and rating columns stored as integers |
| Size              | ~0.3 MB CSV file                                                                  |
| Nulls             | Zero missing values across all 35 columns confirmed                               |
| Duplicates        | No duplicate employee records found                                               |
| Constant Columns  | EmployeeCount, StandardHours, Over18 contain single values throughout             |

---

## Null Values Per Column

All 35 columns returned zero null values. The dataset was confirmed as complete with no imputation required at this stage.

---

## Sampling and Memory Optimizations

- Dataset is small enough for full processing without sampling.
  - Constant columns identified for removal to reduce feature dimensionality.
  - Target variable Attrition confirmed as object type requiring binary encoding.
- 

## 2. Data Cleaning and Preprocessing

This step cleaned the dataset by removing irrelevant columns, encoding the target variable, and confirming data integrity. The cleaned dataset served as the direct input for feature engineering and model training.

---

### Remove Constant Columns

Four columns were dropped as they carry no analytical value:

- EmployeeCount — value of 1 for every record
  - StandardHours — value of 80 for every record
  - Over18 — value of Y for every record
  - EmployeeNumber — unique identifier with no predictive relevance
- 

### Encode Target Variable

The Attrition column was mapped from string to binary:

- Yes → 1
- No → 0

Class distribution confirmed:

- Stayed (0): 1,233 employees — 83.9%
- Left (1): 237 employees — 16.1%

This confirmed significant class imbalance requiring SMOTE rebalancing before model training.

---

### Confirm Cleaned Dataset

- Shape after cleaning: 1,470 rows × 31 columns
- Zero null values confirmed post-cleaning
- All column data types verified as appropriate for downstream processing
- Cleaned dataset saved as processed-data.csv

---

## Feature Dictionary

| Column                   | Description                                                     |
|--------------------------|-----------------------------------------------------------------|
| Age                      | Employee age in years                                           |
| Attrition                | Target variable — 1 if left, 0 if stayed                        |
| BusinessTravel           | Travel frequency — Non-Travel, Travel_Rarely, Travel_Frequently |
| DailyRate                | Daily compensation rate                                         |
| Department               | Employee department — HR, R&D, Sales                            |
| DistanceFromHome         | Commute distance in kilometres                                  |
| Education                | Education level — 1 to 5                                        |
| EducationField           | Field of education                                              |
| EnvironmentSatisfaction  | Work environment satisfaction — 1 to 4                          |
| Gender                   | Employee gender                                                 |
| HourlyRate               | Hourly compensation rate                                        |
| JobInvolvement           | Job involvement score — 1 to 4                                  |
| JobLevel                 | Seniority level — 1 to 5                                        |
| JobRole                  | Employee job function                                           |
| JobSatisfaction          | Job satisfaction score — 1 to 4                                 |
| MaritalStatus            | Marital status — Single, Married, Divorced                      |
| MonthlyIncome            | Monthly salary in USD                                           |
| MonthlyRate              | Monthly rate value                                              |
| NumCompaniesWorked       | Number of previous employers                                    |
| OverTime                 | Whether employee works overtime — Yes or No                     |
| PercentSalaryHike        | Annual salary increase percentage                               |
| PerformanceRating        | Performance rating — 1 to 4                                     |
| RelationshipSatisfaction | Relationship satisfaction — 1 to 4                              |
| StockOptionLevel         | Stock option grant level — 0 to 3                               |
| TotalWorkingYears        | Total years of professional experience                          |
| TrainingTimesLastYear    | Number of trainings attended last year                          |

| Column                  | Description                         |
|-------------------------|-------------------------------------|
| WorkLifeBalance         | Work-life balance score — 1 to 4    |
| YearsAtCompany          | Tenure at current organization      |
| YearsInCurrentRole      | Years in current job role           |
| YearsSinceLastPromotion | Years since most recent promotion   |
| YearsWithCurrManager    | Years working under current manager |

### 3. Feature Engineering and Scaling

This step created six new derived features to capture behavioral and career patterns not directly available in the raw data. Categorical variables were one-hot encoded and all features were standardized using StandardScaler to prepare the final model-ready dataset.

#### Engineered Features

| Feature                | Formula                                                                                                              | Purpose                                       |
|------------------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| IncomePerYear          | $\text{MonthlyIncome} \times 12$                                                                                     | Annualized compensation for scale consistency |
| PromotionGap           | $\text{YearsSinceLastPromotion} \div \text{YearsAtCompany}$                                                          | Career stagnation indicator                   |
| CompanyExperienceRatio | $\text{YearsAtCompany} \div \text{TotalWorkingYears}$                                                                | Organizational loyalty measure                |
| ManagerStability       | $\text{YearsWithCurrManager} \div \text{YearsAtCompany}$                                                             | Relationship consistency metric               |
| WorkloadScore          | $(\text{OverTime} == \text{Yes} \times 2) + (\text{Travel\_Frequently} \times 2) + (\text{Travel\_Rarely} \times 1)$ | Combined workload intensity index             |
| SalaryGrowth           | $\text{PercentSalaryHike} \div \text{YearsAtCompany}$                                                                | Compensation growth rate                      |

#### One-Hot Encoding

Seven categorical columns were encoded using `get_dummies` with `drop_first=True`:

- BusinessTravel → BusinessTravel\_Travel\_Frequently, BusinessTravel\_Travel\_Rarely
- Department → Department\_Research & Development, Department\_Sales
- EducationField → five binary columns
- Gender → Gender\_Male
- JobRole → eight binary columns
- MaritalStatus → MaritalStatus\_Married, MaritalStatus\_Single
- OverTime → OverTime\_Yes

---

## Feature Scaling

StandardScaler was fitted on the full feature matrix X and applied to all 50 columns. The scaler was saved as scaler.pkl for use during backend inference to ensure prediction consistency.

---

## Final Dataset Shape

- Rows: 1,470
- Feature columns: 50
- Target column: Attrition
- Total shape:  $1,470 \times 51$

Artifacts saved:

- feature\_columns.pkl — ordered list of all 50 feature names
  - scaler.pkl — fitted StandardScaler object
  - feature-engineered-data.csv — scaled dataset for model training
- 

## 4. Model Training and Hyperparameter Tuning

This step trained three classification models on the rebalanced dataset, applied GridSearchCV for hyperparameter optimization, and retrained final models on the full dataset for production deployment.

---

## Class Imbalance Handling

SMOTE was applied to the training split to address the 84/16 class imbalance:

- Original training distribution: 986 stayed, 190 left
  - Resampled training distribution: 986 stayed, 986 left
- 

## Models Trained

| Model               | Optimization Metric | Cross-Validation Folds |
|---------------------|---------------------|------------------------|
| Logistic Regression | Recall              | 5-fold StratifiedKfold |
| Random Forest       | Recall              | 5-fold StratifiedKfold |
| XGBoost             | Recall              | 5-fold StratifiedKfold |

---

## Best Hyperparameters

| Model               | Best Parameters      | Best CV Recall |
|---------------------|----------------------|----------------|
| Logistic Regression | C: 10, solver: lbfgs | 82.1%          |

| Model         | Best Parameters                                          | Best CV Recall |
|---------------|----------------------------------------------------------|----------------|
| Random Forest | n_estimators: 100, max_depth: None, min_samples_split: 2 | 91.7%          |
| XGBoost       | learning_rate: 0.2, max_depth: 7, n_estimators: 100      | 90.97%         |

## Production Retraining

Final models were retrained on the full 1,470-record dataset using the best parameters found during GridSearchCV, then saved as production artifacts:

- xgboost.pkl
- random-forest.pkl
- logistic-regression.pkl
- shap\_explainer.pkl — TreeExplainer fitted on the final XGBoost model

## 5. Model Evaluation and Threshold Optimization

This step evaluated all three models using a custom classification threshold of 0.3 instead of the standard 0.5. The threshold was deliberately lowered because missing an employee who is about to leave (False Negative) is far more costly to the organization than raising a false alarm (False Positive). The system optimizes for Recall.

### Custom Threshold Justification

At threshold 0.5, Recall scores ranged from 28% to 57% — unacceptable for HR use where every missed at-risk employee represents a real financial and operational loss. At threshold 0.3, Recall improves to 90%+ across all models, ensuring the platform catches the maximum number of flight risks.

### Evaluation Results at Threshold 0.3

| Model               | Accuracy | Recall | Precision | F1 Score | AUC-ROC |
|---------------------|----------|--------|-----------|----------|---------|
| Logistic Regression | 57.5%    | 95.7%  | 30.2%     | 45.9%    | 81.3%   |
| Random Forest       | 54.1%    | 97.9%  | 29.1%     | 44.8%    | 87.2%   |
| XGBoost             | 53.1%    | 90.2%  | 28.4%     | 43.2%    | 89.7%   |

### Confusion Matrix — XGBoost

|               | Predicted No | Predicted Yes |
|---------------|--------------|---------------|
| Actual No 130 | 117          |               |
| Actual Yes 5  | 42           |               |

### Model Selection Guidance

| Model               | When to Deploy                                                  |
|---------------------|-----------------------------------------------------------------|
| XGBoost             | Balanced operational performance with optimal F1 score          |
| Random Forest       | Maximum risk coverage — minimum at-risk employees missed        |
| Logistic Regression | Strict explainability — clear mathematical feature coefficients |

---

### 6. Attrition Driver Analysis

This step analyzed the key features driving attrition predictions across all three models, computed attrition rates by workforce segment, and produced the critical signal data used in the Batch Analysis page of the platform.

---

#### Top Attrition Drivers — XGBoost Feature Importance

| Rank | Feature                   | Importance |
|------|---------------------------|------------|
| 1    | OverTime_Yes              | 16.0%      |
| 2    | JobLevel                  | 8.4%       |
| 3    | StockOptionLevel          | 6.0%       |
| 4    | TotalWorkingYears         | 5.5%       |
| 5    | JobRole_Human Resources   | 4.0%       |
| 6    | JobRole_Research Director | 3.0%       |
| 7    | YearsWithCurrManager      | 2.9%       |
| 8    | JobSatisfaction           | 2.5%       |

---

#### Attrition Rate by Department

| Department               | Attrition Rate |
|--------------------------|----------------|
| Sales                    | Highest        |
| Human Resources          | Moderate       |
| Research and Development | Lowest         |

---

#### Attrition Rate by Job Role

| Job Role             | Attrition Rate |
|----------------------|----------------|
| Sales Representative | ~40%           |

| Job Role | Attrition Rate |
|----------|----------------|
|----------|----------------|

|                       |      |
|-----------------------|------|
| Laboratory Technician | ~24% |
|-----------------------|------|

|                 |      |
|-----------------|------|
| Human Resources | ~23% |
|-----------------|------|

|                    |      |
|--------------------|------|
| Research Scientist | ~16% |
|--------------------|------|

|         |     |
|---------|-----|
| Manager | ~5% |
|---------|-----|

|                   |       |
|-------------------|-------|
| Research Director | ~2.5% |
|-------------------|-------|

---

### Attrition Rate by Overtime Status

#### Overtime Attrition Rate

|     |      |
|-----|------|
| Yes | ~31% |
|-----|------|

|    |      |
|----|------|
| No | ~10% |
|----|------|

Employees working overtime are approximately 3× more likely to leave. Overtime is the single strongest controllable retention lever identified in the dataset.

---

### Attrition Rate by Age Bracket

#### Age Bracket Attrition Rate

|       |         |
|-------|---------|
| 18–24 | Highest |
|-------|---------|

|       |           |
|-------|-----------|
| 25–34 | Very high |
|-------|-----------|

|       |          |
|-------|----------|
| 35–44 | Moderate |
|-------|----------|

|       |     |
|-------|-----|
| 45–54 | Low |
|-------|-----|

|     |        |
|-----|--------|
| 55+ | Lowest |
|-----|--------|

---

### Attrition Rate by Marital Status

#### Marital Status Attrition Rate

|        |         |
|--------|---------|
| Single | Highest |
|--------|---------|

|          |          |
|----------|----------|
| Divorced | Moderate |
|----------|----------|

|         |        |
|---------|--------|
| Married | Lowest |
|---------|--------|

---

### Critical System Signals

- Approximately 46.9% of high-risk employees are on mandatory overtime
- High-risk employees earn on average \$1,400 less per month than low-risk employees

- Employees with Stock Option Level 0 show attrition rates more than 4× higher than Level 3
- The 25–35 age bracket represents the highest concentration of flight risk across all departments

---

## Workforce Health Metrics

| Metric                            | Value                                                        |
|-----------------------------------|--------------------------------------------------------------|
| Workforce Health Index            | Score derived from high-risk employee percentage             |
| Financial Liability               | High-risk employee count × \$50,000 average replacement cost |
| Attrition Rate                    | 16.1% baseline across full dataset                           |
| Avg Replacement Cost per Employee | 6× monthly salary                                            |

---

## 7. Employee Trends Visualization

This step produced the full suite of visual analyses used across the Dataset page and Batch Analysis page of the Retainify platform. All charts were generated from the IBM HR dataset using matplotlib and seaborn.

---

## Visualizations Produced

| Chart                                 | Insight                                                    |
|---------------------------------------|------------------------------------------------------------|
| Attrition distribution donut          | 83.9% stayed / 16.1% left baseline split                   |
| Attrition by overtime                 | 31% attrition for overtime workers vs 10% for non-overtime |
| Attrition by department               | Sales highest, R&D lowest                                  |
| Attrition by job role                 | Sales Representative and Lab Technician most vulnerable    |
| Age vs attrition histogram            | 25–35 bracket highest concentration of leavers             |
| Monthly income by attrition           | Leavers earn significantly less on average                 |
| Attrition by marital status           | Single employees most likely to leave                      |
| Work-life balance vs attrition        | Low scores strongly predict attrition                      |
| Job satisfaction vs attrition         | Low satisfaction appears in majority of leaver profiles    |
| Environment satisfaction vs attrition | Below-average satisfaction in leaver group                 |
| Years at company vs attrition         | Shorter tenure strongly correlated with attrition          |
| Stock option level vs attrition       | Level 0 far more likely to leave than Level 2 or 3         |
| Job level vs attrition                | Entry-level employees show highest attrition rates         |
| Feature correlation heatmap           | OverTime_Yes highest positive correlation with attrition   |
| XGBoost feature importance bar        | Top 15 features ranked by model importance score           |

---

## 8. Backend API Development

The FastAPI backend serves as the intelligence layer of the platform, handling all prediction, simulation, and analytics requests from the React frontend.

---

### Architecture

backend/

```
|— main.py
|— app/
|   |— __init__.py
|   |— routes/
|       |— __init__.py
|       |— main.py
|   |— services/
|       |— __init__.py
|       |— prediction.py
|   |— ml/
|       |— __init__.py
|       |— loader.py
|— trained_models/
|   |— xgboost.pkl
|   |— random-forest.pkl
|   |— logistic-regression.pkl
|   |— feature_columns.pkl
|   |— scaler.pkl
|   |— shap_explainer.pkl
|— datasets/
    |— raw-data.csv
```

---

### API Endpoints

| Method | Endpoint | Purpose                                 |
|--------|----------|-----------------------------------------|
| POST   | /upload  | Upload and validate CSV or XLSX dataset |
| POST   | /predict | Single employee attrition prediction    |

| Method | Endpoint            | Purpose                                         |
|--------|---------------------|-------------------------------------------------|
| POST   | /simulate           | Real-time recalculation for retention simulator |
| POST   | /batch-analysis     | Batch prediction across all uploaded employees  |
| GET    | /performance        | Return model evaluation metrics                 |
| GET    | /feature-importance | Return XGBoost feature importance rankings      |
| GET    | /dataset-analytics  | Return auto-computed workforce analytics        |

---

## Preprocessing Pipeline

The backend preprocessor mirrors the exact feature engineering steps from training notebooks to ensure inference consistency:

- Reads raw form input values from the prediction request
- Computes all 6 engineered features using the same formulas
- Constructs one-hot encoded binary columns for all categorical variables
- Aligns columns to the saved feature\_columns.pkl ordered list
- Applies scaler.transform() using the saved StandardScaler

---

## SHAP Explanation

For every single prediction, the backend:

- Runs TreeExplainer.shap\_values() on the scaled input
- Extracts per-feature SHAP impact values
- Sorts by absolute impact and returns the top 6 factors
- Labels each factor with a human-readable name and business description
- Tags each factor as Increases Risk or Lowers Risk based on SHAP sign

---

## Recommendation Engine

Rule-based recommendations are generated from raw form input values:

| Condition                   | Recommendation                | Priority |
|-----------------------------|-------------------------------|----------|
| OverTime == Yes             | Reduce Overtime Exposure      | High     |
| MonthlyIncome < \$4,000     | Review Compensation Package   | High     |
| WorkLifeBalance <= 1        | Improve Work-Life Balance     | High     |
| YearsSinceLastPromotion > 3 | Accelerate Career Progression | High     |
| JobSatisfaction <= 2        | Enhance Job Engagement        | Medium   |

| Condition                           | Recommendation               | Priority |
|-------------------------------------|------------------------------|----------|
| EnvironmentSatisfaction <= 2        | Improve Work Environment     | Medium   |
| StockOptionLevel == 0               | Introduce Stock Incentives   | Medium   |
| BusinessTravel == Travel_Frequently | Optimize Travel Requirements | Medium   |

## 9. Frontend Dashboard

The React frontend provides an enterprise-grade interactive interface for HR teams to explore attrition predictions, workforce analytics, and model performance.

### Application Structure

frontend/src/

```

├── App.tsx
├── index.tsx
├── context/
│   └── AppContext.tsx
├── services/
│   └── api.ts
├── components/
│   └── Navbar.tsx
└── pages/
    ├── HomePage.tsx
    ├── PredictPage.tsx
    ├── DatasetPage.tsx
    ├── PerformancePage.tsx
    └── BatchPage.tsx

```

### Page Descriptions

**Home Page** Landing page explaining the Retainify platform, featuring an animated hero illustration with live risk gauges, four feature cards, and an About section covering the attrition problem statement.

**Predict Page** Primary prediction interface with a file upload overlay, intelligence model selector, personal profile form, job and career details form, and satisfaction sliders. After prediction the form is replaced by a two-column results layout — Risk Assessment and Prediction Explanation on the left, Retention Simulator and Recommendations on the right. The Retention Simulator calls /simulate on every slider change for real-time probability updates.

**Dataset Page** Automatic workforce analytics page loaded from /dataset-analytics. Displays KPI bar, attrition overview, 10 charts covering distribution and breakdown across all key features, a full EDA section with imbalance analysis, age vs attrition chart, role vulnerability index, overtime over-index chart, and a dataset profile summary table.

**Model Performance Page** Technical validation page displaying the threshold optimization strategy with a line chart, business justification for the 0.3 threshold, recall comparison bar chart, ROC/AUC multi-model curve, accuracy vs recall trade-off chart, statistical evaluation table, and a model selection guidance matrix.

**Batch Analysis Page** Workforce command center loaded automatically from /batch-analysis. Displays four KPI cards, risk segment breakdown, workforce health index, financial liability estimate, departmental risk heatmap, job role vulnerability ranking, critical system signals, suggested action plan, a searchable and sortable employee results table with pagination, and workforce retention recommendations.

---

## State Management

Global state managed through React Context API preserves:

- datasetUploaded — controls upload overlay visibility and page unlock
- predictionResult — shared prediction data across Predict page components
- batchResults — batch analysis results for Batch page
- selectedModel — active model selection persisted across interactions
- datasetInfo — uploaded file metadata

---

## 10. Deployment and Documentation

---

### Deployment Architecture

| Layer           | Platform Details |                                                                   |
|-----------------|------------------|-------------------------------------------------------------------|
| Frontend        | Vercel           | React production build, CDN-served, automatic GitHub deploys      |
| Backend         | Render           | FastAPI Web Service, uvicorn server, 750 hours free tier          |
| Version Control | GitHub           | Full source code, pkl files, and dataset committed to main branch |

---

### Environment Configuration

Frontend environment variable set in Vercel:

- REACT\_APP\_API\_URL — points to the Render backend URL

Backend startup sequence on Render:

- Build command: pip install -r requirements.txt
- Start command: uvicorn main:app --host 0.0.0.0 --port \$PORT
- On startup: load\_all() loads all six pkl files from trained\_models/
- On startup: raw-data.csv auto-loaded from datasets/ for instant analytics

---

## **Deliverables**

- Live production frontend — Vercel URL
  - Live production backend — Render URL
  - GitHub repository with full source code, notebooks, and trained models
  - Six production pkl artifacts in trained\_models/
  - IBM HR raw dataset in datasets/
  - Seven Jupyter notebooks covering the full ML pipeline
  - README with setup instructions, architecture overview, and deployment guide
  - UML class diagram, component diagram, and project workflow diagram
  - Implementation plan document
-
